

[FAQ14769]L版本OTA升级遇到error："system has been remounted R/W; reflash device to reenable OTA updates"

[DESCRIPTION]

L版本；如果有在bootable/recovery/目录下code中添加[ensure_path_mounted](#)(“/system”);

或者是在recovery mode下执行[root integrity check](#)之后，导致OTA升级失败，而且last_log中有如下error：

```
script aborted: system has been remounted R/W; reflash device to reenable OTA updates
system has been remounted R/W; reflash device to reenable OTA updates
```

[SOLUTION]

可以尝试在/bootable/recovery/roots.cpp中作如下修改：(蓝色为添加部分)

```
int ensure_path_mounted(const char* path) {
} else if (strcmp(v->fs_type, "ext4") == 0 ||
strcmp(v->fs_type, "vfat") == 0) {
if (strcmp(v->mount_point, "/system") == 0)//add
result = mount(v->device, v->mount_point, v->fs_type, MS_NOATIME | MS_NODEV |
MS_NODIRATIME | MS_RDONLY, "");//add
else //add
result = mount(v->device, v->mount_point, v->fs_type,
MS_NOATIME | MS_NODEV | MS_NODIRATIME, "");
```

如果问题还是不能解决，请提eservice给Mediatek，谢谢！
