## [FAQ12441][NvRam] Normal mode下, sensor校准数据,恢复出厂设置,不丢失

## [DESCRIPTION]

目前支持的ACC, GYRO, PS 三种sensor的校准数据,是保存在nvram中,并且也有加入到nvram binregion中,可以实现恢复出厂设置后, sensor校准数据的恢复。

但是nvram binregion中的sensor数据是要在产线上做校准并保存的,而且永远都是这个固定值。

但是客户实际上是在normal mode下,需要随时做校准,而且需要保存最近的校准值不丢失。

因nvram binregion和sensor daemon源码不开放,所以无法将sensor nvram保存在pro\_info中。

现提供对sensor nvram的backup的功能,来实现sensor数据的保存。

## [SOLUTION]

- 1. 确认打开 MTK\_PRODUCT\_INFO\_SUPPORT 修改alps/mediatek/config/\$project/ProjectConfig.mk: MTK\_PRODUCT\_INFO\_SUPPORT=yes MTK\_PRODUCT\_INFO\_SUPPORT 也必须存在于 AUTO\_ADD\_GLOBAL\_DEFINE\_BY\_NAME 中。
- 2. 定义所需要保存的结构体

这里定义了 ACC, GYRO, PS 三种结构体到一个backup的数据中,可以根据需要做添加或删除,文件名字可以自定义,或者添加到已有的文件中。

\mediatek\custom\\$project\cgen\cfgfileinc\CFG\_XXXX\_File.h

//the new record for the hwmon sensor backup data #defineCFG\_HWMON\_BACKUP\_RESERVED\_SIZE(1024-CFG\_FILE\_HWMON\_ACC\_REC\_SIZE-CFG\_FILE\_HWMON\_GYRO\_REC\_SIZE-CFG\_FILE\_HWMON\_PS\_REC\_SIZE)

typedef struct{
NVRAM\_HWMON\_ACC\_STRUCThwmon\_acc;
NVRAM\_HWMON\_GYRO\_STRUCThwmon\_gyro;
NVRAM\_HWMON\_PS\_STRUCThwmon\_ps;

```
unsigned char reserved[CFG_HWMON_BACKUP_RESERVED_SIZE];
HWMON BACKUP STRUCT;
#defineCFG_FILE_HWMON_BACKUP_SIZEsizeof(HWMON_BACKUP_STRUCT)
#defineCFG FILE HWMON BACKUP TOTAL1
//此结构体数据的default值
\mediatek\custom\$project\cgen\cfgdefault\CFG XXXX Default.h
HWMON BACKUP STRUCT st hwmon backup default =
//acc
\{0\},\
//gyro
\{0\},\
//ps
\{0\},\
//reserved
{0}
};
3. 添加新的nvram数据的定义
\mediatek\custom\\project\cgen\inc\Custom_NvRam_LID. h
//添加LID定义
AP CFG RDCL HWMON BACKUP LID, //new add
AP CFG CUSTOM FILE MAX LID,
} CUSTOM CFG FILE LID;
//添加LID版本信息
#define AP CFG RDCL HWMON BACKUP LID VERNO "000"
//注意此table中添加的位置,需要和 CUSTOM CFG FILE LID 中的位置对应。
\mediatek\custom\$project\cgen\inc\CFG_file_info_custom.h
```

```
const TCFG_FILE g_akCFG_File_Custom[]=
{ "/data/nvram/APCFG/APRDCL/HWMON_BACKUP",
VER(AP_CFG_RDCL_HWMON_BACKUP_LID), CFG_FILE_HWMON_BACKUP_SIZE,
CFG FILE HWMON BACKUP TOTAL, SIGNLE DEFUALT REC, (char
*)&st hwmon backup default, DataReset , NULL
};
//Meta tool需要读取的信息
\mediatek\custom\\project\cgen\inc\Custom_NvRam_data_item.h
LID BIT VER LID(AP CFG RDCL HWMON BACKUP LID)
HWMON BACKUP STRUCT *CFG FILE HWMON BACKUP TOTAL
};
4. 添加nvram到product_info
JB: \mediatek\custom\common\cgen\CFG_file_info.c
KK: \mediatek\external\nvram\libcustom_nvram\CFG_file_info.c
const TABLE_FOR_SPECIAL_LID g_new_nvram_lid[] =
{ AP CFG REEB PRODUCT INFO LID, 0, 1024 * 1024 },
{ AP CFG RDCL HWMON BACKUP LID, 1024 * 1024, 1024 * 1024 },
};
注意:这里LID的struct和offset size的定义,在使用nand和emmc有所不同,请参考
后面note中的FAQ注意事项。
   实现备份还原的code
\mediatek\external\nvram\libnvram daemon callback\libnvram daemon callback
. c
```

```
int my callback(void)
ALOGD("nvram daemon callback will run!!!");
my nvram daemon(); //add
return 0:
int my nvram daemon(void)
int err = 0, ret = 0;
F ID fd:
int rec size, rec num;
HWMON BACKUP STRUCT hwmon backup;
NVRAM_LOG("ready to read hwmon backup\n");
/* read the hwmon backup data */
fd = NVM GetFileDesc(AP CFG RDCL HWMON BACKUP LID, &rec size, &rec num,
ISREAD);
if(fd. iFileDesc < 0)
NVRAM LOG("null hwmon backup file handle pointer: %d!\n", fd.iFileDesc);
err = -EFAULT;
return err:
ret = read(fd. iFileDesc, &hwmon backup, (rec size * rec num));
if(ret < 0)
NVRAM LOG("read hwmon backup file error: %d!\n", ret);
err = -EFAULT;
NVM CloseFileDesc(fd):
NVRAM_LOG("hwmon_backup_data, hwmon_acc:%d-%d-%d\n",
hwmon backup. hwmon acc. offset[0], hwmon backup. hwmon acc. offset[1],
hwmon backup. hwmon acc. offset[2]);
/* set the hwmon acc data */
fd = NVM GetFileDesc(AP CFG RDCL HWMON ACC LID, &rec size, &rec num,
ISWRITE);
ret = write(fd. iFileDesc, &hwmon backup. hwmon acc, (rec size * rec num));
NVM CloseFileDesc(fd);
NVRAM_LOG("hwmon_backup_data, hwmon_gyro:%d-%d-%d\n",
hwmon_backup.hwmon_gyro.offset[0], hwmon_backup.hwmon_gyro.offset[1],
hwmon backup. hwmon gyro. offset[2]);
/* set the hwmon gyro data */
fd = NVM GetFileDesc(AP CFG RDCL HWMON GYRO LID, &rec size, &rec num,
ISWRITE);
ret = write(fd. iFileDesc, &hwmon backup. hwmon gyro, (rec size * rec num));
NVM CloseFileDesc(fd);
```

```
NVRAM_LOG("hwmon backup data, hwmon_ps:%d-%d-%d\n", hwmon_backup.hwmon_ps.ps_cali[0], hwmon_backup.hwmon_ps.ps_cali[1], hwmon_backup.hwmon_ps.ps_cali[2]);
/* set the hwmon ps data */
fd = NVM_GetFileDesc(AP_CFG_RDCL_HWMON_PS_LID, &rec_size, &rec_num, ISWRITE);
ret = write(fd.iFileDesc, &hwmon_backup.hwmon_ps, (rec_size * rec_num));
NVM_CloseFileDesc(fd);
return err;
}
7. sensor校准客制化
```

这里实现了对sensor 校准数据的backup,但是在具体sensor的校准数据保存的地方,需要将数据同时保存到 AP\_CFG\_RDCL\_HWMON\_BACKUP\_LID 上,否则无效。
